Teleworkable Score (0–1)	(0.18)	(0.25)	(0.24)	
D (0.1)	$0.85^{'}$	$\stackrel{ extbf{-}}{0.57}$	$0.64^{'}$	
Remote Score (0–1)	(0.30)	(0.41)	(0.40)	
	271	2740	2126	
Employees (Count)	(1432)	(9555)	(8380)	
A	7	43	34	
Age	(2)	(34)	(33)	
D (((/ · · · · · ·)	49	37	40	
Rent $(\$/\text{sq ft})$	(21)	(19)	(20)	
Cantrality Com	1419	949	1066	
Centrality Score	(1830)	(1309)	(1470)	
Soniority Loyala (Count)	3.62	3.86	3.80	
Seniority Levels (Count)	(0.77)	(0.50)	(0.59)	
Number of firms	878	2630	3508	
Observations	10450	31530	41980	
Panel B: User-level				
——————————————————————————————————————	526.52	311.88	355.99	
Total Contributions	(932.95)	(470.01)	(601.57)	
D 4 : 4 1 C 4 : 1 4:	468.96	231.83	280.56	
Restricted Contributions	(887.00)	(407.75)	(550.40)	
Number of firms	379	759	1138	
Number of users	1210	4051	4820	
Observations	10896	42124	53020	

Notes: Panel A is on firm–period observations. Its bottom rows ("Number of firms" and "Observations") define the sample; above are mean (SD) across firm–periods. Panel B is based on worker–period observations and ends with three rows: "Number of firms", "Number of users", and "N" (worker–period observations). Growth, Leave, and Join rates are fractions between 0 and 1. Teleworkable and Remote scores are index values between 0 and 1. The sample period spans 2016 H2–2022 H1 at the firm level and 2017 H1–2022 H1 at the user level.

3 Mechanisms

We begin with the "base" specification:

```
y_{it} = \alpha + \beta_1 \left( remote_i \times covid_t \right) + \beta_2 \left( remote_i \times covid_t \times startup_i \right) + \delta \left( covid_t \times startup_i \right) + \text{FE}_{it} + \varepsilon_{it},
```

which captures how the outcome responds to remote work during COVID and whether that effect differs in young firms.

In the **rent** "mirror" model we add two additional channels:

```
\begin{aligned} y_{it} &= \alpha + \beta_1 \left( remote_i \times covid_t \right) + \beta_2 \left( remote_i \times covid_t \times startup_i \right) \\ &+ \delta \left( covid_t \times startup_i \right) + \gamma_1 \left( covid_t \times rent_i \right) + \gamma_2 \left( remote_i \times covid_t \times rent_i \right) \\ &+ \mathrm{FE}_{it} + \varepsilon_{it}, \end{aligned}
```

so that γ_1 and γ_2 capture how both the baseline COVID effect and the remotework premium vary with local office rents.

Likewise, the **centrality** (HHI) model adds:

```
\begin{aligned} y_{it} &= \alpha + \beta_1 \left( remote_i \times covid_t \right) + \beta_2 \left( remote_i \times covid_t \times startup_i \right) \\ &+ \delta \left( covid_t \times startup_i \right) + \gamma_1 \left( covid_t \times hhi_i \right) + \gamma_2 \left( remote_i \times covid_t \times hhi_i \right) \\ &+ \mathrm{FE}_{it} + \varepsilon_{it}. \end{aligned}
```

By turning on each check-mark (rent, centrality, seniority) one at a time—and then in combination—we "mirror" the base COVID×Remote specification through different mechanisms.
